# STEP-PS/1AC/12DC/3

# Primary-switched power supply for building automation

## INTERFACE

Data sheet 103507\_en\_01

© PHOENIX CONTACT - 07/2009

### 1 Description

#### Features

- Easy assembly on the DIN rail or panel
  - Maximum energy efficiency thanks to low idling losses
  - Quick startup with LED function monitoring
  - High operating safety due to long mains buffering under full load and high MTBF (> 500,000 h)
  - Can be used worldwide in all industrial sectors due to a wide-range input and an international approval package
  - Wide temperature range of -25°C to +70°C
  - Parallel connection possible for increased performance and redundancy

# STEP POWER power supply units – for building automation

The new STEP POWER generation of compact power supply units is particularly suitable for installation distributors and flat control panels thanks to its design. The power supply units are available with 24 V DC output voltage in four performance classes and widths and with the special voltages 5, 12, 15 and 48 V DC. Their high degree of efficiency and the low standby losses make for high power efficiency.

## DANGER OF EXPLOSION!

Only remove equipment when it is disconnected and not in the potentially explosive area.

## DANGER

The device contains dangerous live elements and high levels of stored energy. Never carry out work when the power is turned on.

Make sure you always use the latest documentation. It can be downloaded at <u>www.phoenixcontact.net/download</u>

## 3 Ordering data

Description	Туре	Order No.	Pcs. / Pkt
DIN rail power supply unit 12 V DC/3 A, primary switched-mode, 1-phase <b>Technical data</b>	STEP-PS/1AC/12DC/3	2868570	1
Input data			
Input nominal voltage range	100 V AC 240 V AC		
AC input voltage range	85 V AC 264 V AC		
DC input voltage range	95 V DC 250 V DC		
AC frequency range	45 Hz 65 Hz		
DC frequency range	0 Hz		
Current consumption	Approx. 0.6 A (120 V AC) Approx. 0.3 A (230 V AC)		
Inrush current limitation	< 15 A (typical)		
l <sup>2</sup> t	< 0.6 A <sup>2</sup> s		
Power failure bypass	> 26 ms (120 V AC) > 160 ms (230 V AC)		
Typical response time	< 0.5 s		
Protective circuitry	Transient surge protection Varis	tor	
Input fuse, integrated	3.15 A (slow-blow, internal)		
Recommended backup fuse for mains protection	6 A 10 A 16 A (characteristic B)		
Output data			
Nominal output voltage	12 V DC ±1%		
Setting range of the output voltage	10 V DC 16.5 V DC (> 12 V co	onstant capacity)	
Output current	3 A (-25°C 70°C) 3.3 A (-25 °C 40 °C permaner 4.9 A (maximum output current)	it)	
Derating	Above +55°C: 2.5% per Kelvin		
Control deviation	< 1 % (change in load, static 10° < 2 % (change in load, dynamic < 0.1 % (change in input voltage	10% 90%)	
Power loss nominal load max.	6.4 W		
Maximum power dissipation idling	0.5 W		
Efficiency	> 85 % (for 230 V AC and nomin	al values)	
Ascent time	< 0.5 s (U <sub>OUT</sub> (10% 90%))		
Residual ripple	< 40 mV <sub>PP</sub> (with nominal values	1	
Peak switching voltages	< 40 mV <sub>PP</sub> (with nominal values		
Connection in parallel	Yes, for redundancy and increas	ed capacity	
Connection in series	Yes		
Surge protection against internal surge voltages	Yes, limited to approx. 25 V DC		
Resistance to reverse feed	max. 25 V DC

## 5 Structure

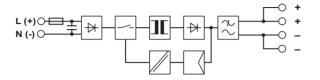

- 1 AC input
- 2 DC output
- 3 "DC OK" LED
- 4 Potentiometer 10.0 V DC ... 16.5 V DC
- 5 Universal snap-on foot for EN DIN rails and for wall mounting

	[mm <sup>2</sup> ]		AWG	[Nm]
	solid	stranded		Torque
Input	0.2 - 2.5	0.2 - 2.5	24 - 12	0.6 - 0.8
Output	0.2 - 2.5	0.2 - 2.5	24 - 12	0.6 - 0.8

Input data			
Input nominal voltage range	100 V AC 240 V AC		
AC input voltage range	85 V AC 264 V AC		
DC input voltage range	95 V DC 250 V DC		
AC frequency range	45 Hz 65 Hz		
DC frequency range	0 Hz		
Input fuse, integrated	3.15 A (slow-blow, internal)		
Recommended backup fuse for mains protection	6 A 10 A 16 A (characteristic B)		
Type of connection	Screw connection		
Stripping length	6.5 mm		
Output data			
Nominal output voltage	12 V DC ±1%		
Setting range of the output voltage	10 V DC 16.5 V DC (> 12 V constant capacity)		
Output current	3 A (-25°C 70°C) 3.3 A (-25 °C 40 °C permanent) 4.9 A (maximum output current)		
Type of connection	Screw connection		
Stripping length	6.5 mm		

## 6 Block diagram

## 7 Safety notes

#### DANGER OF EXPLOSION!

Only remove equipment when it is disconnected and not in the potentially explosive area. **DANGER** 

The device contains dangerous live elements and high levels of stored energy. Never carry out work when the power is turned on.

## WARNING

Before startup please ensure:

The mains connection has been carried out by a competent person and protection against electric shock is guaranteed!

The device can be disconnected outside the power supply unit in accordance with the regulations as in EN 60950 (e.g. through primary side line protection)!

All feed lines are sufficiently protected and dimensioned!

All output lines are dimensioned according to the maximum output current of the device or separately protected!

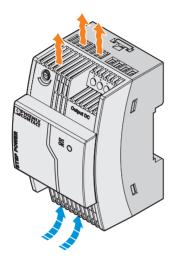

Sufficient convection is guaranteed!

#### CAUTION

The power supply units are built-in devices. The device may only be installed and put into operation by qualified personnel. The corresponding national regulations must be observed.

#### 8 Installation

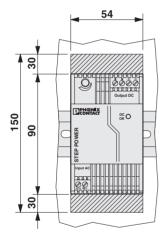

i

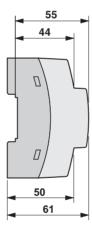

## ATTENTION

In order to ensure sufficient convection, we recommend a minimum vertical distance of 30 mm to the other devices.

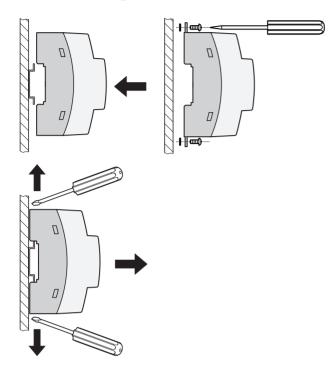

The power supply unit can be snapped onto all DIN rails as per EN 60715; it can also be mounted on walls. The device must be mounted vertically (connecting terminals above or below).

#### 9 Installation position

## 10 Mounting on DIN rails

### Assembly

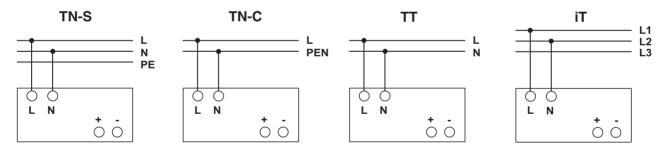

To mount on an EN DIN rail, snap the device straight onto the DIN rail.

If the power supply unit is to be fastened directly onto an even surface, press the orange base latch upward and down. Place a washer between the pulled-out base latch and the even surface (max. outer diameter 8.5 mm, max. thickness 1.3 mm, e.g., spring washer for M4 in acc. with DIN 127-B or toothed lock washer in acc. with DIN 6797). Then fasten the device with two screws (max. thread diameter 4 mm, max. head diameter 8.5 mm).

#### Removing

To dismantle from the EN DIN rail, press the orange base latch outward and pull the device off of the DIN rail. In the case of wall mounting, loosen the screws and press the base latch inwards again.

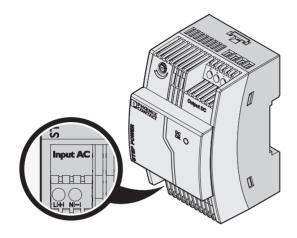

## 11 Connection to various systems

The 100 V AC ... 240 V AC connection is made using the L and N screw connections. The device can be connected to 1-phase AC networks or to two of the phase conductors of three-phase systems (TN, TT or IT networks in acc. with VDE 0100-300/IEC 60364-3) with nominal voltages of 100 V AC ...240 V AC.

For operation on two of the phase conductors of a three-phase system, an isolating facility for all poles must be provided.

## 12 Input

## CAUTION

If an internal fuse is triggered, there is most probably a malfunction in the device. In this case, the device must be inspected in the factory!

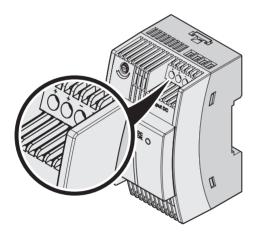

#### Protection of the primary side

The device must be installed in acc. with the regulations as in EN 60950. It must be possible to disconnect the device using a suitable isolating facility outside the power supply. The primary side line protection, for example, is suitable. For device protection, there is an internal fuse. Additional device protection is not necessary.

#### Recommended backup fuse for mains protection

Power circuit-breaker 6 A, 10 A or 16 A, characteristic B (or identical function). Connect a suitable fuse upstream for DC applications!

## 13 Output

## CAUTION

Make sure that all output lines are dimensioned according to the maximum output current or are separately protected. The cables on the secondary side must have sufficiently large cross sections in order to keep the voltage drops on the lines as low as possible.

The connection is made using the "+" and "-" screw connections on the screw connection of the DC output. The set output voltage is 12 V DC at the time of delivery. The output voltage can be set on the potentiometer.

#### Protection of the secondary side

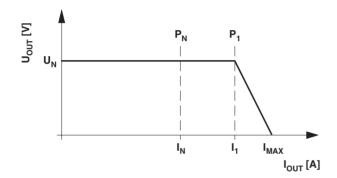

The device is electronically protected against short circuit and idling. In the event of a malfunction, the output voltage is limited to 25 V DC.

## 14 Signaling

The "DC OK" LED enables evaluation of the function of the power supply directly on site.

	State 1	State 2
"DC OK" LED	ON	OFF
Cause	Output voltage > 10.8 V	Output voltage < 10.8 V or no voltage at the output
Meaning	Output voltage and output current OK	The device is in operation, but there is a fault in the consumer, the current consumption is greater than $I_1$ or the output is short circuited. The device is out of operation because there is no mains voltage, the fuse on the primary side has been triggered, or the device is faulty.

## 15 Function

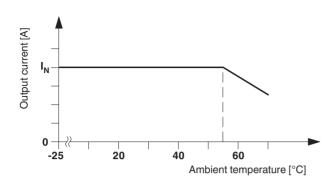

#### Output characteristic curve

The power supply works with a power reserve as shown in the U/I characteristic curve in the figure. At ambient temperatures  $T_{AMB} < +40^{\circ}$ C,  $I_1$  is available continuously. At higher temperatures, it's available for a few minutes. In the event of a secondary-side short circuit or overload, the output current is limited to  $I_{MAX}$ . Thereby, the module does not switch off, but rather supplies a continuous output current. The secondary voltage is reduced here until the short circuit is eliminated. The U/I characteristic curve with the power reserve ensures that both high inrush currents of capacitive loads as well as consumers with DC/DC converters in the primary circuit can be supplied.

$$U_{N} = 12 V$$
$$I_{N} = 3 A$$
$$P_{N} = 36 W$$
$$I_{1} = 3.3 A$$

P<sub>1</sub> = 39.6 W

 $I_{MAX} = 4.9 \text{ A} (U_{OUT} = 0 \text{ V})$ 

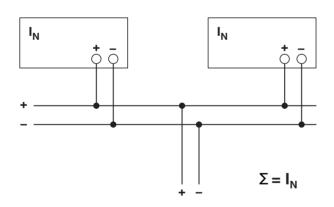

#### Thermal behavior

With an ambient temperature of up to +55°C, the device supplies the continuous output current of  $I_N$ . In the case of ambient temperatures above +55°C, the output current must be reduced by 2.5% per Kelvin increase in temperature. The device does not switch off at ambient temperatures of +70°C or thermal overload. The output capacity is reduced as far as necessary to provide device protection. After it has cooled down, the output capacity is increased again.

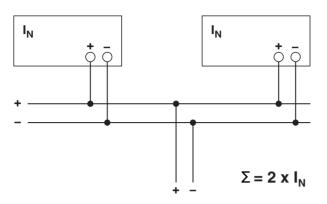

#### **Parallel operation**

Devices of the same type can be connected in parallel to enable both redundancy and an increase in efficiency. On default upon delivery, a further adjustment is not needed. If the output voltage is adjusted, a uniform distribution of power is guaranteed by setting all parallel operated power supply units to exactly the same output voltage. To ensure symmetrical current distribution we recommend that all cable connections from the power supply unit to the busbar are the same length and have the same cross-section! Depending on the system, for parallel connection of more than two power supply units a protective circuit should be installed at each individual device output (e.g. decoupling diode, DC fuse or power circuit breaker). This prevents high return currents in the event of a secondary device fault.

#### **Redundant operation**

Redundant circuits are suitable for the supply of systems which make especially high requirements on the operational safety. If a fault occurs in the primary circuit of the first power supply unit, the second device automatically takes over the entire power supply, without interruption, and vice versa. For this reason, the power supply units to be connected in parallel are dimensioned in such a way that the total current requirement of all consumers can be completely covered by one power supply unit. 100% redundancy makes external decoupling diodes necessary (QUINT-DIODE/40, Order No. 2938963)!

#### **Increased performance**

For n parallel connected devices, the output current can be increased to n x  $I_N$ . Parallel connection to increase efficiency is used for the expansion of existing systems. It is advisable to use parallel connection if the power supply unit does not cover the current requirement of the most powerful consumer. Otherwise the consumers should be spread among individual devices independent of one another. A maximum of five devices can be connected in parallel!
